Noise-Canceling Earmuff Offers Complete Protection

The NoiseBuster ENC provides protection from all noise frequencies. It works using a microphone inside the ear cup to listen to noise coming into the ear. Using electronics, the system takes that information and uses it to create a noise wave that is identical to, but directly opposite of, the one coming into the ear. The “anti-noise” wave is output through a speaker also located in the ear cup. When the two waves (the noise wave and the anti-noise wave) meet, the noise is significantly reduced.

Noise reduction is rated 26 decibels when worn over the head and 25 decibels when worn behind the head.
