NoiseBuster Noise Cancellation Headphones

NCT Group

Model NB-FX, \$69.95 USD

protechcommunications.com

When listening to music on the computer or on portable devices such as MP3s, we must often make due with annoying background noise. This could change thanks to noise-cancelling headphones such as these from Pro Tech. Here's how they work: built-in microphones capture the outside sound and electronically invert it in order to cancel the sound. LSM tested a model of the

headphones to see whether this scientific innovation translated well into the realm of the practical. The new version of the NoiseBuster headphones gives the user the option of two modes, noise cancellation on or off. When turned on, the headphones effectively reduced lower frequency noise allowing high frequencies to be heard clearly. According to the company's specifications, the unit works best in the 60Hz-500Hz range, reducing noise by 10dB-20dB. The NoiseBuster headphones are thus most effective for travelling and working with a computer.
